

Evaluation of Fiber-Optic Loop Sensor Mounting on Laminated Glass Fiber Composites Based on Power Modulation

Robert Gandolfo and John Schineller

Dr. Nguyen Q. Nguyen and Dr. Nikhil Gupta

Mechanical & Aerospace Engineering Department

Polytechnic Institute of New York University

Presentation at SMART Mechatronics Symposium

August 14, 2009

Objectives

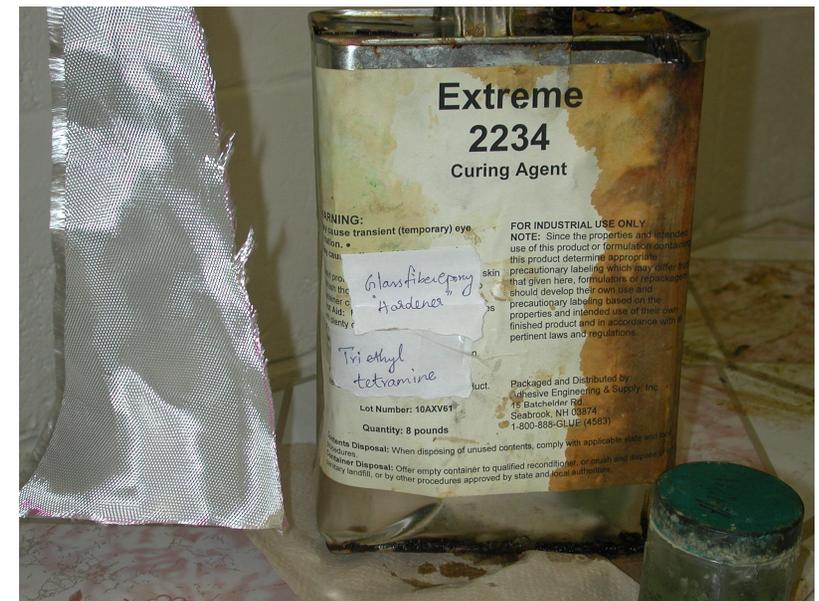

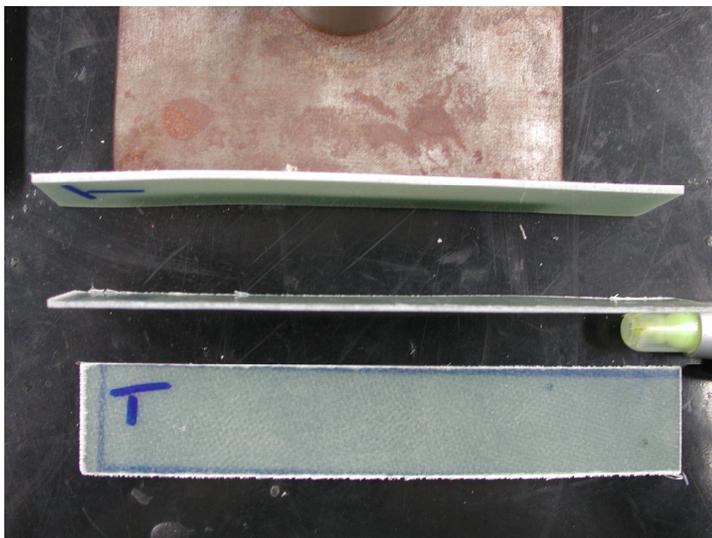

- Use a fiber optic loop as a sensor
 - Measure intensity losses and calibrate with load and deflection of a composite material
- Evaluate fiber optic loop sensor configurations
 - Repeatability
 - Sensitivity

Outline

- Fabricated laminate composites
- Three point bending test
 - Quasi-static testing
 - Young's modulus
- Tested eight loop sensor configurations
 - Optical intensity / Load testing
- Limited repeatability
 - Normalize the data
- Areas of further study

Composite Fabrication

- Angle orientation
 - $0^\circ / 90^\circ$; $15^\circ / 75^\circ$; $30^\circ / 60^\circ$; $\pm 45^\circ$
- 4 Layer / 8 Layer
 - Tk ~1mm ~2 mm
- Epoxy resin / Hardener
- Samples 1" BY 6"

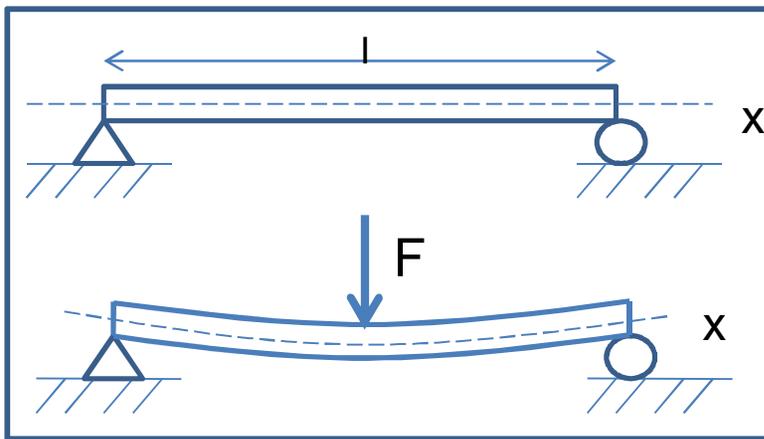

Composite Testing

- Three point bending
 - Quasi-static test
- Young's modulus
 - $E = L^3 D / 48 I$
 - $D =$ load verses deflection slope
 - $L =$ span
 - $I =$ Moment of inertia (mm^4)
 $I = \{b h^3 / 12\}$
 - $b =$ width $h =$ height

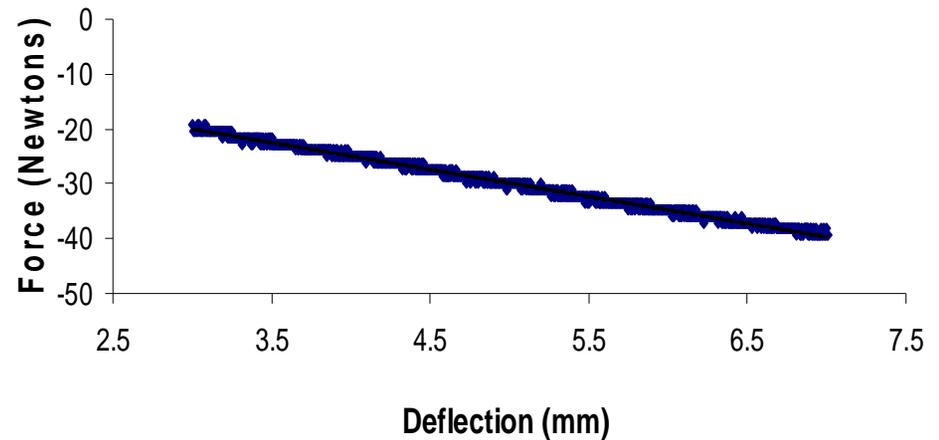

Three Point Bending

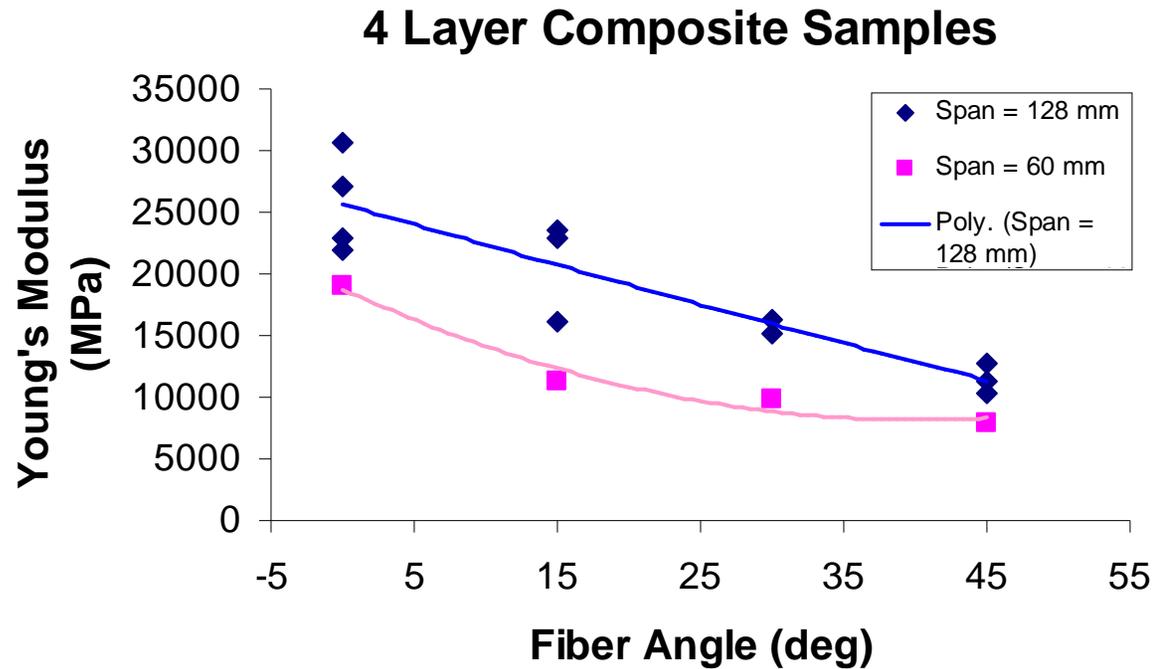

- Instron 4469 span 60mm ; 128 mm
- 50 kN load cell

4 Layer 15-75 Deg
Span = 60mm

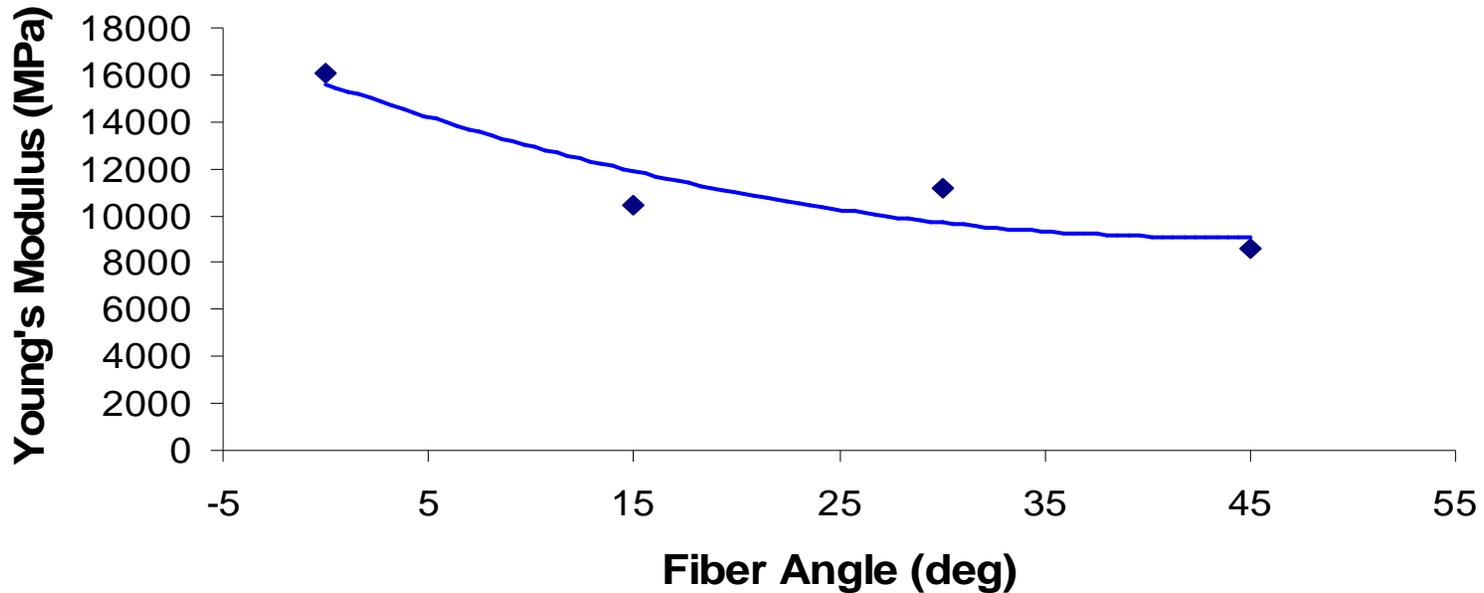

Young's Modulus

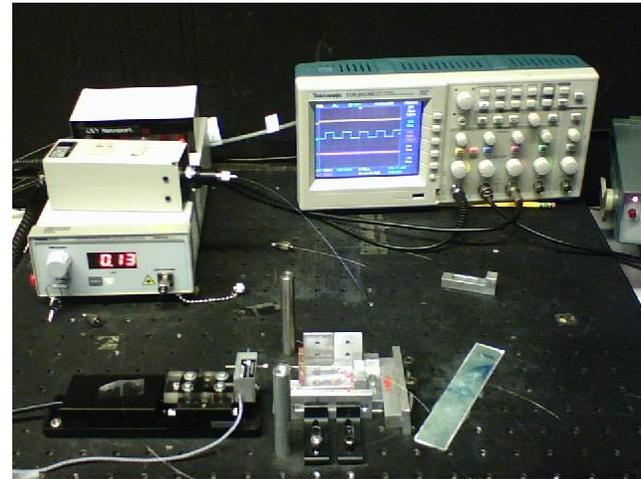

Young's Modulus

8 Layers Composite Samples Span = 60 mm

Optical Fiber Testing

- Fiber connectors
- Fiber in test stand
- Translation stage
- Load cell
- Laser source to optical detector

Data Acquisition

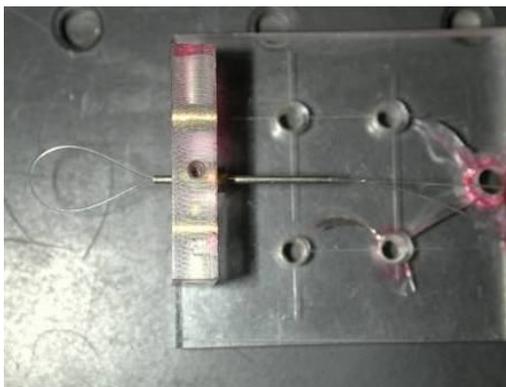

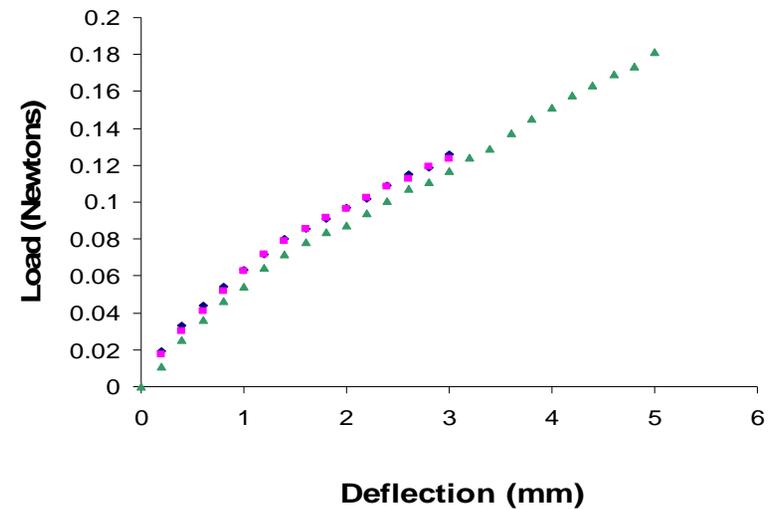

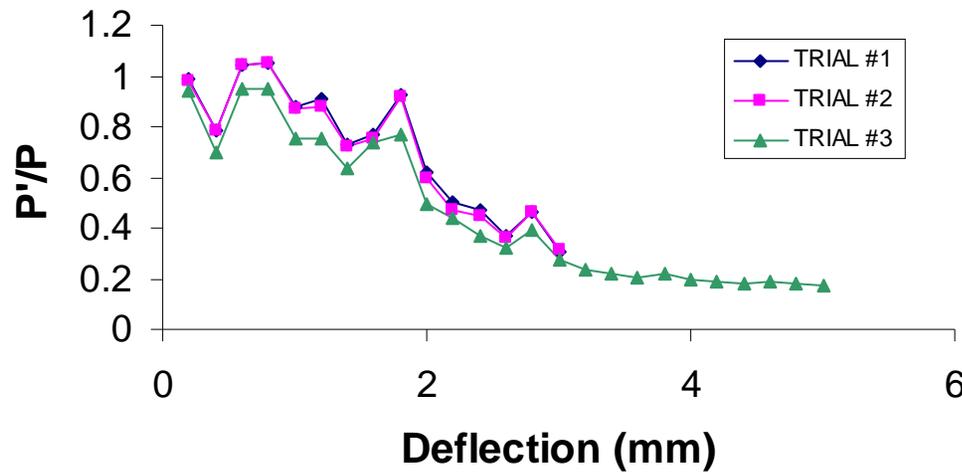

- Apt motor controller
 - Deflection (mm)
- Labview (Signal Express) and oscilloscope
 - Load (mVolts)
 - Optical signal (mVolts)

Results of Tested Configurations

- Eight fiber loop sensor configurations
 - Loop in free space
 - Attached fiber to sample
 - loop
 - ellipse
 - Through a hole
 - Weaved into sample
 - Loop behind sample
 - test jig

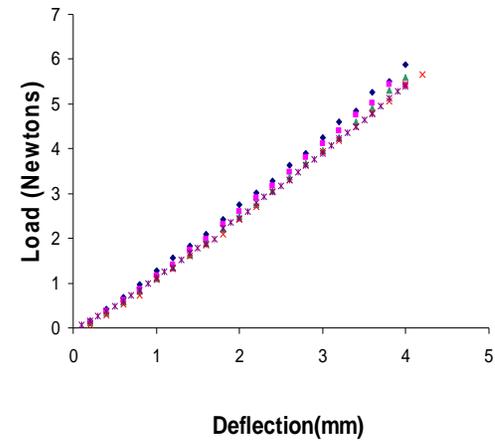

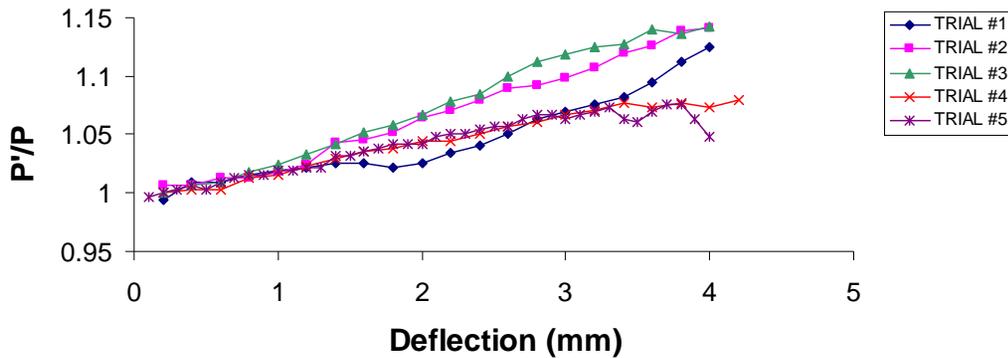

Loop in Free Space

Test Configuration 1 5mm Loop Placed in Free Space Loaded Parallel to Major Axis of Loop

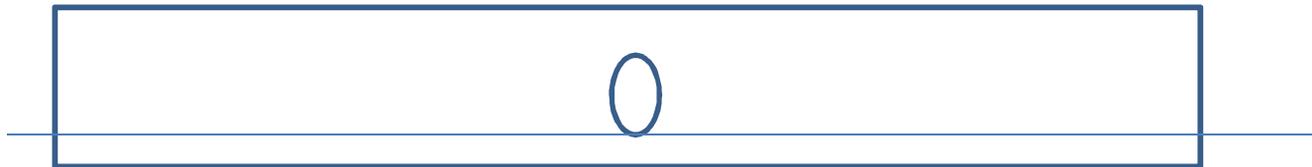

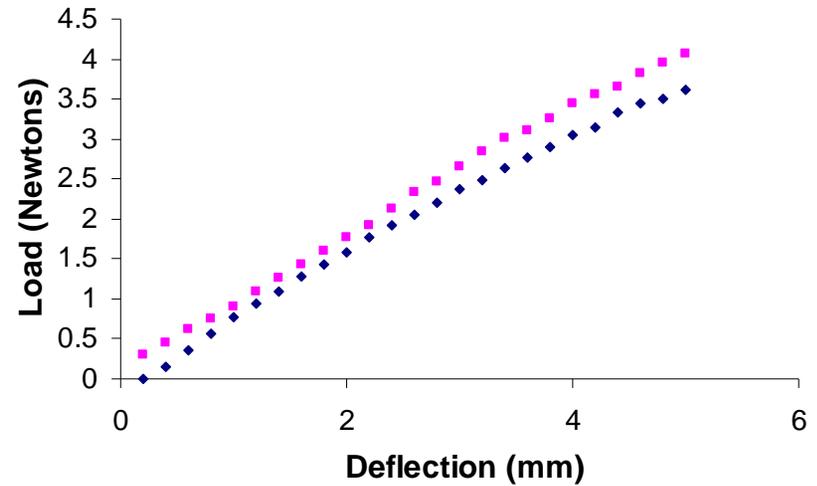

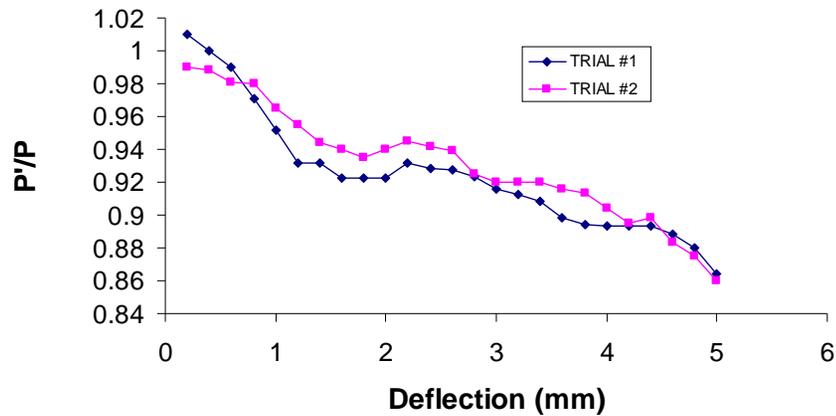

Weaved Fiber

Test Configuration #5
 Weaved Through Two Holes .5 inches apart Middle Loop R
 = 2.71 mm Outer Loops
 R = 2.3mm 4 Layer 15-75 deg Laser = .13mW

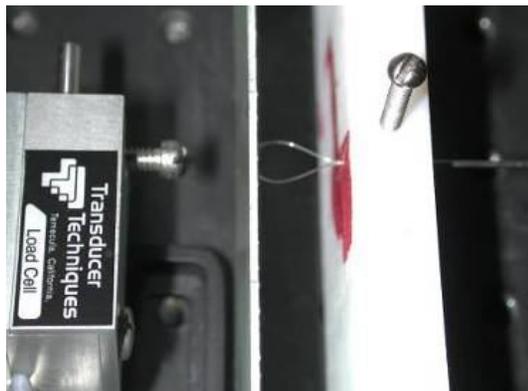

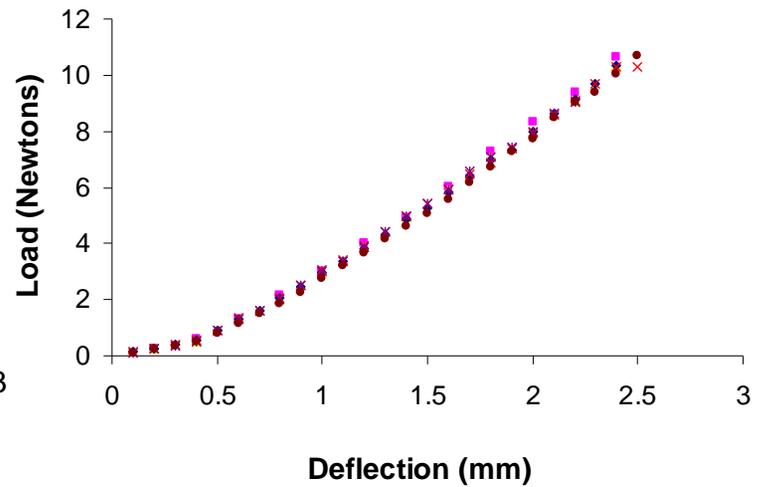

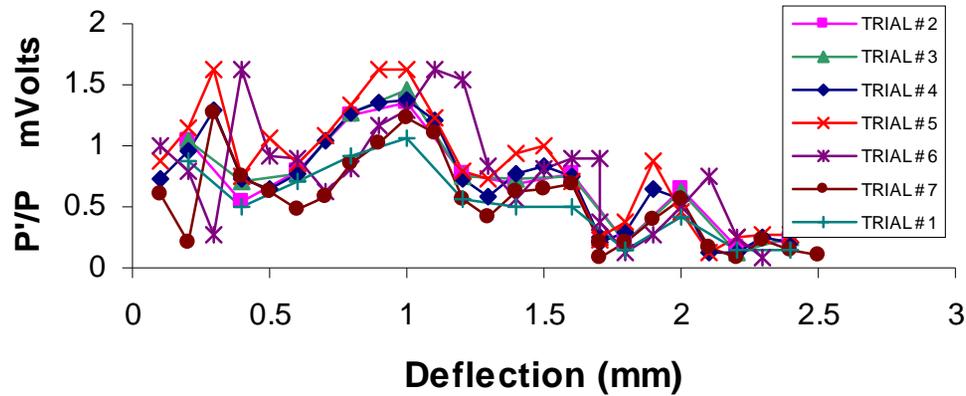

Vertical Ellipse

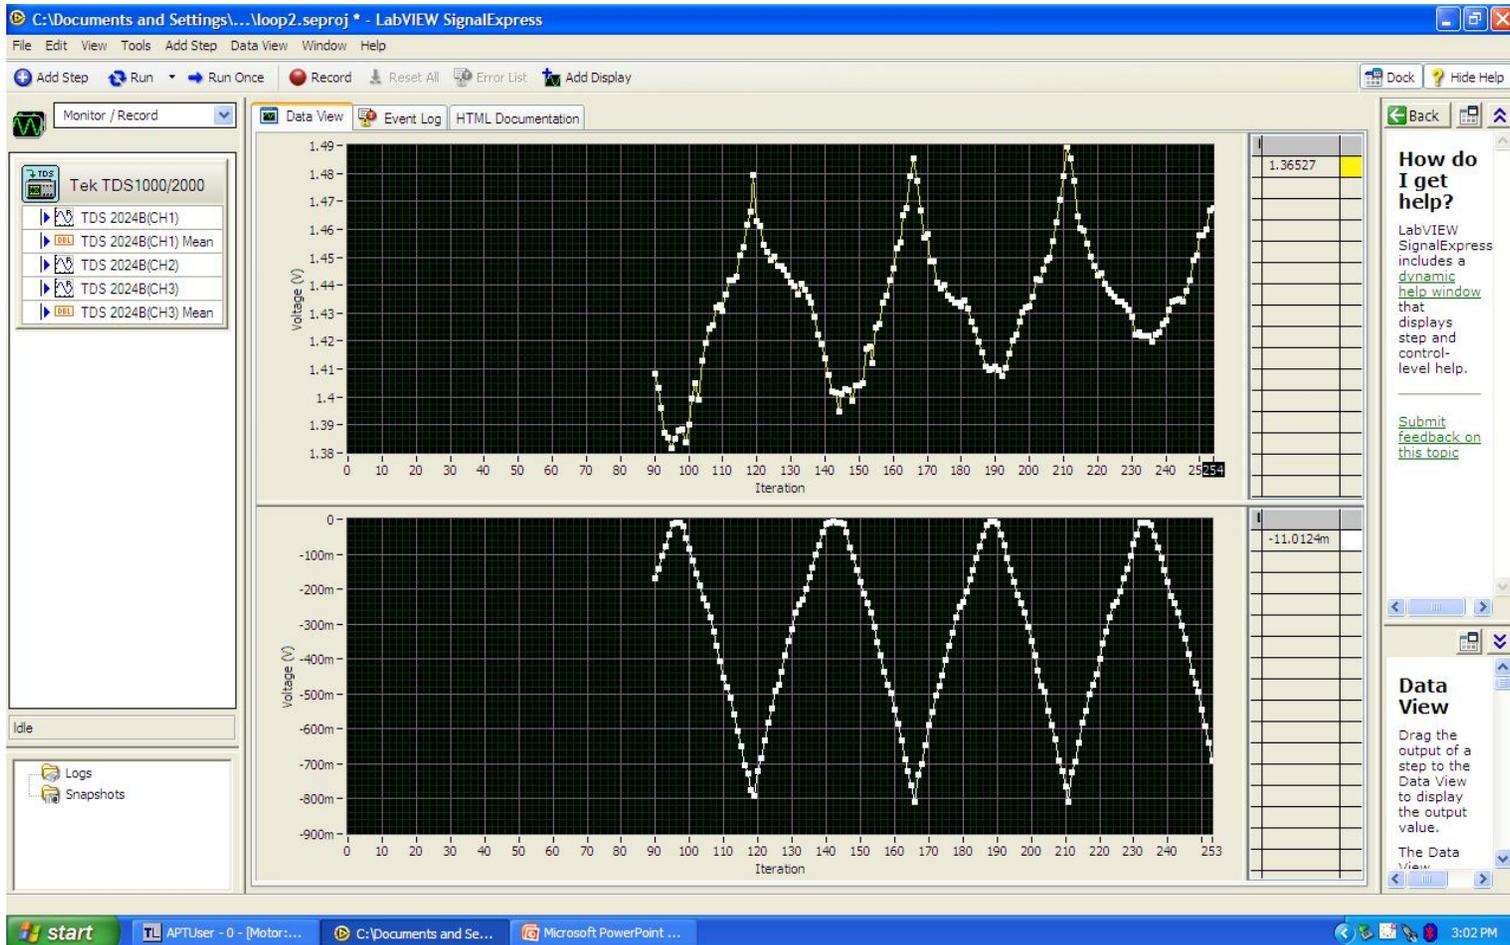

Test Configuration #2
5 mm Loop in a Vertical Ellipse (Minor dia=7.42mm)
Parallel to Surface of Composite 4 Layer +/- 45 deg Laser = .13 mW

Test Jig

Sample Signal Express Data

Data Analysis

- Load data repeatable
 - Slight shifts
- Optical data
 - Shift in magnitude
 - Lateral shifts
 - Initial state
 - Limited repeatability (strain guage)

Limited Repeatability

- Variation in laser intensity
- Variation in optical detector
- Optical connectors
- Data spikes (filter)
- Samples deform (aluminum/ steel)
- Temp effects
- Wear in

Conclusions

- Free space 5mm loop
 - Very repeatable response
 - Limited real world application
- Jig test -3mm – 5mm loops
 - Moderate repeatability
 - Potential sensors.
 - Greater spatial requirements
- Low profile loops
 - Limited repeatability
 - More research required

Recommendations for Further Research

- Optical signal splitter
- Stabilize the laser signal
- Filter noise
- Uniform material for initial testing
