

# **New York University Tandon School of Engineering**

Department of Finance and Risk Engineering

FRE6811 – Financial Software Laboratory – C++ (1.5 Units)

**Fall 2018**

**Professor Jason Yarmish**

Tuesdays 6:00pm-8:41pm; 11/06/18 – 12/18/18

[Nov: 6, 13, 20, 27 ; Dec: 4, 11, 18]

JAB, Room 678

To contact professor: Yarmish@nyu.edu

**Course Pre-requisite:** Graduate Standing

**Course Description:** This course will teach the fundamentals of procedural programming using C++. It is intended for those with little programming background, although prior programming experience will make it easier. The course emphasizes writing programs and becoming proficient with the language and its use in financial applications.

**We will learn:** Writing algorithms, debugging and testing programs, loops and conditional control structures, functions and parameter passing, arrays, memory allocation, program tracing and classes. Examples of programming applications include implied volatility and Monte Carlo simulation.

**By the end of this course, you should be able to:**

- Understand and use the basic programming constructs of C++
- Manipulate various C++ data types.
- Isolate and fix common errors in C++ programs
- Write, read and understand C++ programs using the skills learned
- Understand how C++ may be used in financial problem solving

**Coding Environment:** Software developers generally work in an integrated development environment (IDE), which have built-in tools for editing, compiling, running, and debugging programs. We will use the IDE known as Code::Blocks, which is freely available. Click [here](#) to go to the download page for Code::Blocks. Within installation, if asked, please choose MinGW for the compiler.

**Course Structure:** Lectures, lab, discussion, course readings, programming assignments, program critique/peer review, hand written exams. Our online classroom contains all class content. (Additional [Codility Challenges](#) and online discussion among students available to those who want wish to challenge themselves and their skill as they learn.)

**Readings:** There is no textbook for this course, however you may find some of the following online materials helpful. Required readings will come from these sources as well:

[C++ Language Tutorial](#)  
[Wikiversity: Introduction to C++](#)  
[Learn about C++ Programming](#)

**Requirements:** Readings, attendance, class participation, assignments, exams.

**Assessment:** There will be assignments/projects at the end of each lecture. You are encouraged to collaborate, but any code and write-ups you hand in must be your own. Plagiarism will not be tolerated. Review and critique of your fellow students' code is required after the completion of each assignment. There will be two exams and a final.

### Grading Policy

Exam 1:	25%
Exam 2:	25%
Final :	30%
Assignments/Projects:	20%

### Course Overview:

The lecture notes produced in class will be provided after each class.

Please review the programs done in class. Make sure you can go through them line by line and "trace" the programs as we did in class, knowing the value of each variable and the output on the screen at any point in the program.

Week	Topics
1	Overview from source code to executable file Structure of compiler Standard input/output Variables/ The assignment operator/ Comparison operators Concept of Data Types/ basic types (int, float, bool...) Implicit type conversion Introduction to escape characters/commenting/integer division Type Casting Operator Iteration statements: <b>for</b> and <b>while</b> loops and their relationship Increase and decrease operators/ Compound assignment operators
2	Break statement Selection statements: <b>switch</b> and <b>if-else</b> and their relationship Logical operators (&&,   , ...)/ Short circuit evaluation Arrays (declaring/accessing/ manipulating/ structure in memory...) More on nested loops/ Pattern building with loops Introduction to scope / Introduction to namespaces Return value of an assignment Type mismatching Chaining input/output streams

3	<p>Scope and Stack  Functions (Prototypes and Definition)  Using libraries  (example using library functions to estimate <math>\pi</math> using Monte Carlo simulation)  More on creating your own functions with what you know  (Basic Average, Max, Present Value, Black Scholes and Implied Volatility functions)  <b>void</b> type / <b>int&amp;</b> type  Recursion</p> <p><b>Exam1</b></p>
4	<p>Pass by reference vs Pass by value  Pass by array  Preprocessor definitions vs const  Efficiency considerations and const-references  Two-dimensional arrays/ higher-dimensional arrays  Data structures  Introduction to file streams  Introduction to pointers, the address operator and the dereference operator</p>
5	<p>Arrays &amp; averaging averages (an instance of Simpson's Paradox)  File streams continued  Standard input/output vs ifstream/ ofstream  Passing streams to functions  Output formatting  Potential to overwrite library functions  The Ascii Table  Nesting functions  Pointers' relationship with arrays and order of operations</p> <p><b>Exam2</b></p>
6	<p>Introduction to modulus arithmetic/ The C++ modulus operator  uses in creating Fibonacci sequence and with bool, functions and testing multiples  Conditional/ Ternary Operator  Character Arrays  String Class (comparisons/ functions/ manipulation/ find, insert, erase, replace...)  getline vs cin/ String stream  Controlling text files</p>
7	<p>Function overloading  Default function arguments  More on pointers/ Double pointers  Introduction to the heap/ Dynamic Memory  Introduction to classes/ public and private variables and functions  set and get functions/ writing operators/ separating code into .h, .cpp files  Templates</p> <p><b>Final</b></p>

## **Moses Center Statement of Disability**

If you are student with a disability who is requesting accommodations, please contact New York University's Moses Center for Students with Disabilities (CSD) at [212-998-4980](tel:212-998-4980) or [mosescsd@nyu.edu](mailto:mosescsd@nyu.edu). You must be registered with CSD to receive accommodations. Information about the Moses Center can be found at [www.nyu.edu/csd](http://www.nyu.edu/csd). The Moses Center is located at 726 Broadway on the 2nd floor.

### **NYU School of Engineering Policies and Procedures on Academic Misconduct**

- A. Introduction: The School of Engineering encourages academic excellence in an environment that promotes honesty, integrity, and fairness, and students at the School of Engineering are expected to exhibit those qualities in their academic work. It is through the process of submitting their own work and receiving honest feedback on that work that students may progress academically. Any act of academic dishonesty is seen as an attack upon the School and will not be tolerated. Furthermore, those who breach the School's rules on academic integrity will be sanctioned under this Policy. Students are responsible for familiarizing themselves with the School's Policy on Academic Misconduct.
- B. Definition: Academic dishonesty may include misrepresentation, deception, dishonesty, or any act of falsification committed by a student to influence a grade or other academic evaluation. Academic dishonesty also includes intentionally damaging the academic work of others or assisting other students in acts of dishonesty. Common examples of academically dishonest behavior include, but are not limited to, the following:
  - 1. Cheating: intentionally using or attempting to use unauthorized notes, books, electronic media, or electronic communications in an exam; talking with fellow students or looking at another person's work during an exam; submitting work prepared in advance for an in-class examination; having someone take an exam for you or taking an exam for someone else; violating other rules governing the administration of examinations.
  - 2. Fabrication: including but not limited to, falsifying experimental data and/or citations.
  - 3. Plagiarism: intentionally or knowingly representing the words or ideas of another as one's own in any academic exercise; failure to attribute direct quotations, paraphrases, or borrowed facts or information.
  - 4. Unauthorized collaboration: working together on work that was meant to be done individually.
  - 5. Duplicating work: presenting for grading the same work for more than one project or in more than one class, unless express and prior permission has been received from the course instructor(s) or research adviser involved.
  - 6. Forgery: altering any academic document, including, but not limited to, academic records, admissions materials, or medical excuses.
