**EDUCATION INNOVATION**

- **Implementation of people management and leadership module** (CBE-UY 4113: Engineering Laboratory I) that trains students with soft skills and to work more effectively in teams.
- **Implementation of reactor design safety modules** (CBE-UY 3223: Kinetics and Reactor Design) that strengthen safety across the chemical engineering curriculum.
- **Developed new graduate elective** (CBE-GY 9413: Design of Chemical and Biological Microsystems) that complements the department's new cleanroom facilities.
- **Developed an open-ended design project on microsystems** (CBE-GY 9413). The students design a microsystem of their choice (in teams) using what they learned throughout the semester. They are asked to present an executive summary, elevator pitch presentation (analogous to a gateway style business development meeting), a formal project report, and a final presentation.
- **Design of a continuous-flow reactor experiment for chemical engineering laboratory** (CBE-UY 4113/4213). I asked one of my undergraduate researchers to investigate continuous-flow reactor technology that we could potentially purchase for our newly renovated unit operations laboratory. Technology was identified and an experiment designed that combines the Corning Lab Reactor technology with computational fluid dynamics simulations. We are in the process of seeking funds to pay for the new equipment.
- **Socratic reasoning practice in my graduate courses** (CBE-GY 6813/9413). I train the students to ask six types of Socratic questions using journal article assignments twice throughout the semester. Teaching them to peel the onion to the core is integral for their postgraduate careers.
- **Computational fluid dynamics simulations in my graduate courses** (CBE-GY 6813/9413). The students are asked to solve (in a course project and one homework assignment) the coupled PDEs that describe momentum, heat, and mass transfer combined with reactions to practice realistic chemical engineering problems. Applications in the assignments range from microfluidic devices to the design of chemical reactors.

- **Use of my laboratory's research discoveries in lectures and assignments** (All courses). I routinely use our published work to teach concepts in my courses.
- **Development of open-ended projects in undergraduate reactor design** (CHE 354). In the past, I have asked the students to complete an open-ended reactor design project on a societal problem. Examples of topics include pharmacokinetics, alcohol metabolism, and the manufacture of materials for superconducting high-speed train magnets. Some of the applications are derived from my consulting experience.
- **Developed an extra-credit football flag game and an open-ended project disseminated via YouTube videos** (CHE 354). The students are given yellow football flags at the beginning of each semester. The first student who throws a flag when I make a mistake or tell a bad joke in lecture gets awarded extra credit. The students also create a 1-3 min YouTube video that teaches a reactor design topic of their choice.
- **InspirED with Brooklyn Technical High School, Brooklyn, NY:** NSF CAREER Award partnership with one of the top K-12 tech schools in the USA that offers students the opportunity to conduct research in Prof. Hartman's laboratory with the ultimate goals of completing senior research theses and outreaching science and engineering beyond NYU's boarders.
- **Alabama School of Fine Arts, Birmingham, AL:** Partnership with the Science and Mathematics Department that offers K-12 students the opportunity to complete their senior research thesis in Prof. Hartman's laboratory and express ChemE concepts through visual arts.

## OTHER K-12 OUTREACH

**NYU Applied Research Innovations in Science and Engineering (ARISE) program:** This full-time, seven-week program for 10<sup>th</sup> and 11<sup>th</sup> grade New York Students includes: i) college level workshops and seminars, ii) a high-level research experience in the Hartman Laboratory, and iii) mentoring in that placement by a graduate/postdoctoral student. Students are introduced to key elements of academic research: the scientific method and ethics, data collection and analysis, research practices, and lab safety.
