RESEARCH EXPERIENCE

My research spans a range of topics in condensed matter physics, materials science, and computational science. One part of my current projects is aimed at using theoretical approaches for quantum control and the other part consists of investigating the mechanistic simulations of H-ZSM-5 Zeolite using the NWChem and the density functional theory (DFT) to achieve the quantitative understanding of fundamental aspects of catalysts, which are the cornerstone of the chemicals industry, whose products are used in nearly all human endeavors. Modern theoretical and computational science is a confluence of mathematics, physics, computer science, chemistry and sometimes biology, and it is at the interface between these disciplines where many of the most exciting new developments in science are being made.
